EXPERIMENT 7A: UNIFICATION ALGORITHM

AIM: To implement unification algorithm.

PROCEDURE:

1) Initialize the substitution set to be empty.
2) Recursively unify atomic sentences:
   - Check for Identical expression match.
   - If one expression is a variable v_i, and the other is a term t_i which does not contain variable v_i, then:
   - Substitute t_i / v_i in the existing substitutions
   - Add t_i /v_i to the substitution setlist.
   - If both the expressions are functions, then function name must be similar, and the number of arguments must be the same in both the expression.

For each pair of the following atomic sentences find the most general unifier (If exist).

INPUT CODE:

```
def get_index_comma(string):

    index_list = list()

    par_count = 0

    for i in range(len(string)):

        if string[i] == ',' and par_count == 0:

            index_list.append(i)

        elif string[i] == '(':

            par_count += 1

        elif string[i] == ')':

            par_count -= 1
    return index_list

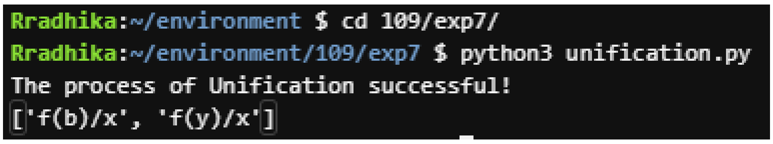
        print(result)
```

OUTPUT:



```
Rradhika:~/environment $ cd 109/exp7/
Rradhika:~/environment/109/exp7 $ python3 unification.py
The process of Unification successful!
['f(b)/x', 'f(y)/x']
```

EXPERIMENT 7B: RESOLUTION ALGORITHM

AIM: To implement resolution algorithm.

PROCEDURE:

Resolution is used, if there are various statements are given, and we need to prove a conclusion of those statements. Unification is a key concept in proofs by resolutions. Resolution is a single inference rule which can efficiently operate on the **conjunctive normal form or clausal form.**

1) Conversion of facts into first-order logic.
2) Convert FOL statements into CNF
3) Negate the statement which needs to prove (proof by contradiction)
4) Draw resolution graph (unification).

INPUT CODE:
